

# DS 100 – Intro to Data Science

Lecture 6 – Visualizations & Functions

02/06/2025

Adam Poliak

BRYN MAWR  
COLLEGE

# Announcements

HW01:

expect grades back this weekend

Lab02 (Data Types and Arrays) due Friday

HW02 - Table Manipulation & Visualization:

- Due Wednesday (02/12)

# Office Hours

TA office hours in Park 230

Patrick Monday OH at HC  
(Lutnick Library 232)

Allison's Tuesday time TBD

Adam's OH:

Thursday @ Dalton 300

Friday @ Park 200C

Adam	Thursday	2:30-3:30
	Friday	11:30 – 1
Allison	Sunday	6-8
	Tuesday	TBD
Patrick	Monday	2-4 (HC)
	Wednesday	4-6
Candy	Wednesday	5-7
	Thursday	5-7

# Course Outline

## Exploration

**Week 1 - 5**

- Discover patterns in data
- Articulate insights (visualizations)

## Inference

**Week 6-10**

- Make reliable conclusions about the world
- Statistics is useful

## Prediction

**Week 11-14**

- Informed guesses about unseen data

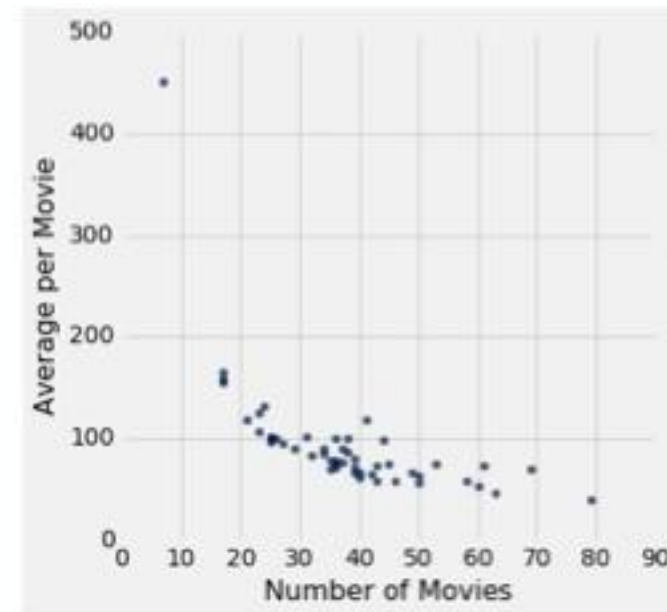

# Plotting Numerical data

## Line graph plot

## Scatter plot scatter

## x-axis and y-axis

Which is the x-axis?

- Year

Which is the y-axis?

- Number of Movies

# Line vs Scatter Plot – when to use which?

Use **line plots** for sequential data if

- x-axis has an order
- sequential differences in y values are meaningful
- there's only one y-value for each x-value
- usually: x-axis is time or distance

Use **scatter plots**

- when looking for associations between numerical attributes

# Plotting in datascience

```
tbl.scatter(x_column, y_column)
```

7

Draws a scatter plot consisting of one point for each row of the table. Note that `x_column` and `y_column` must be strings specifying column names.

1. **string:** name of the column on the x-axis
2. **string:** name of the column on the y-axis

```
tbl.plot(x_column, y_column)
```

7

Draw a line graph consisting of one point for each row of the table.

1. **string:** name of the column on the x-axis
2. **string:** name of the column on the y-axis

# Visualizations

## Line plots

- Sequential data

## Scatter plots

- Finding associations between numerical attributes

## Bar plots

- Categorical distributions

# Bar Plots

Display relationship between categorical variable and a numerical variable

Display a categorical distribution

# Bar Charts

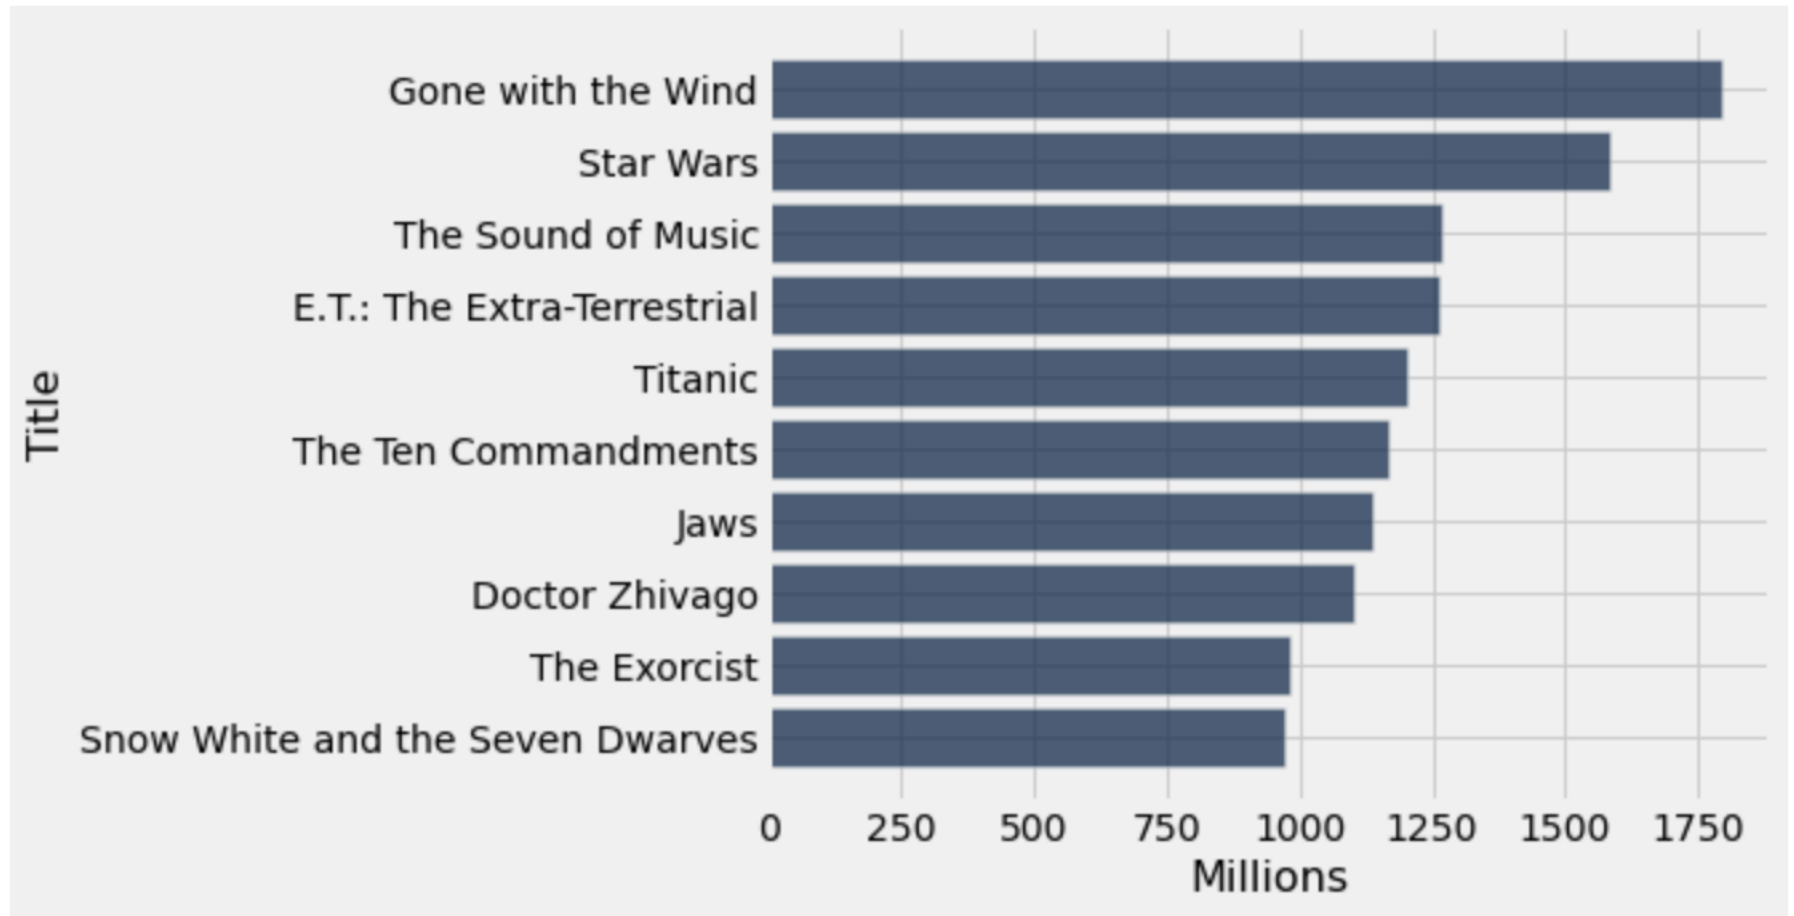

```
top_movies = Table.read_table('top_movies_2017.csv')
top_movies
```

Title	Studio	Gross	Gross (Adjusted)	Year
Gone with the Wind	MGM	198676459	1796176700	1939
Star Wars	Fox	460998007	1583483200	1977
The Sound of Music	Fox	158671368	1266072700	1965
E.T.: The Extra-Terrestrial	Universal	435110554	1261085000	1982
Titanic	Paramount	658672302	1204368000	1997
The Ten Commandments	Paramount	65500000	1164590000	1956
Jaws	Universal	260000000	1138620700	1975
Doctor Zhivago	MGM	111721910	1103564200	1965
The Exorcist	Warner Brothers	232906145	983226600	1973
Snow White and the Seven Dwarves	Disney	184925486	969010000	1937

# Bar Plot

```
: top10_adjusted.barh('Title', 'Millions')
```

# Displaying a categorical distribution

Distribution of a variable describes the frequencies of the values

The **group** method counts the number of values in the column

Bar chart displays the distribution of categorical variable:

- One bar per category/value
- Length of bar is the count of individuals in that category

# Area Principle

# Area Principle

**Areas** should be proportional to values they represent

If you represent 20% by

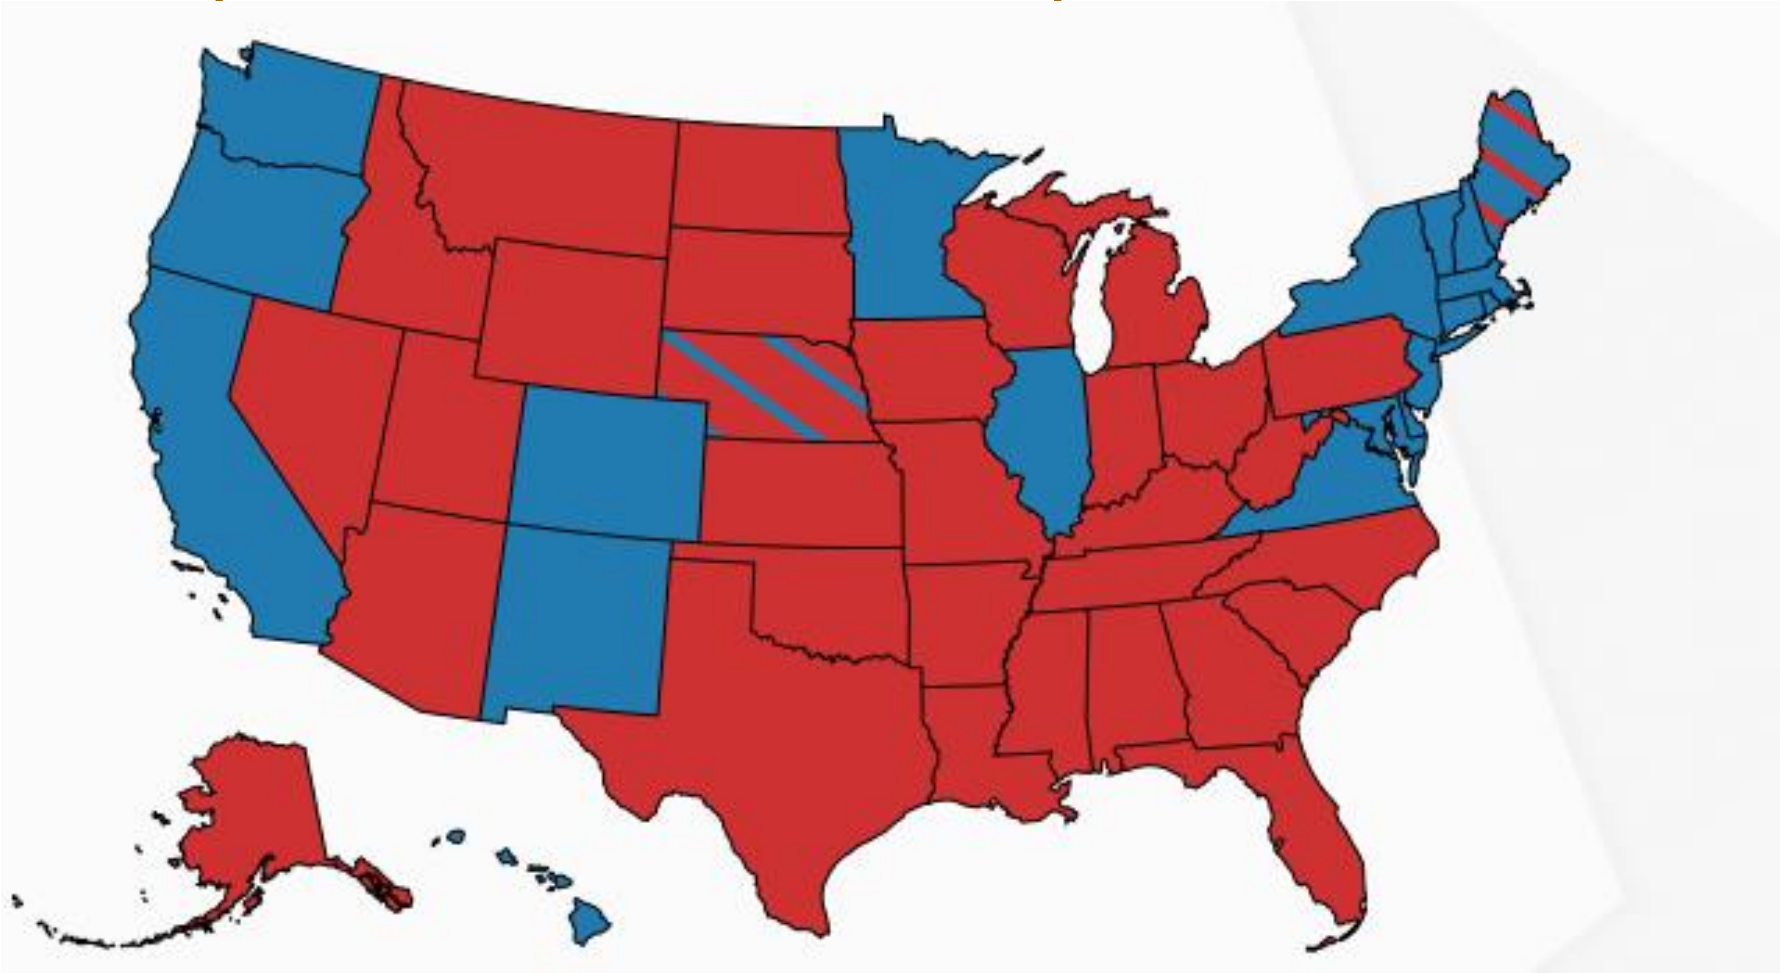

40% should be represented by

and not by

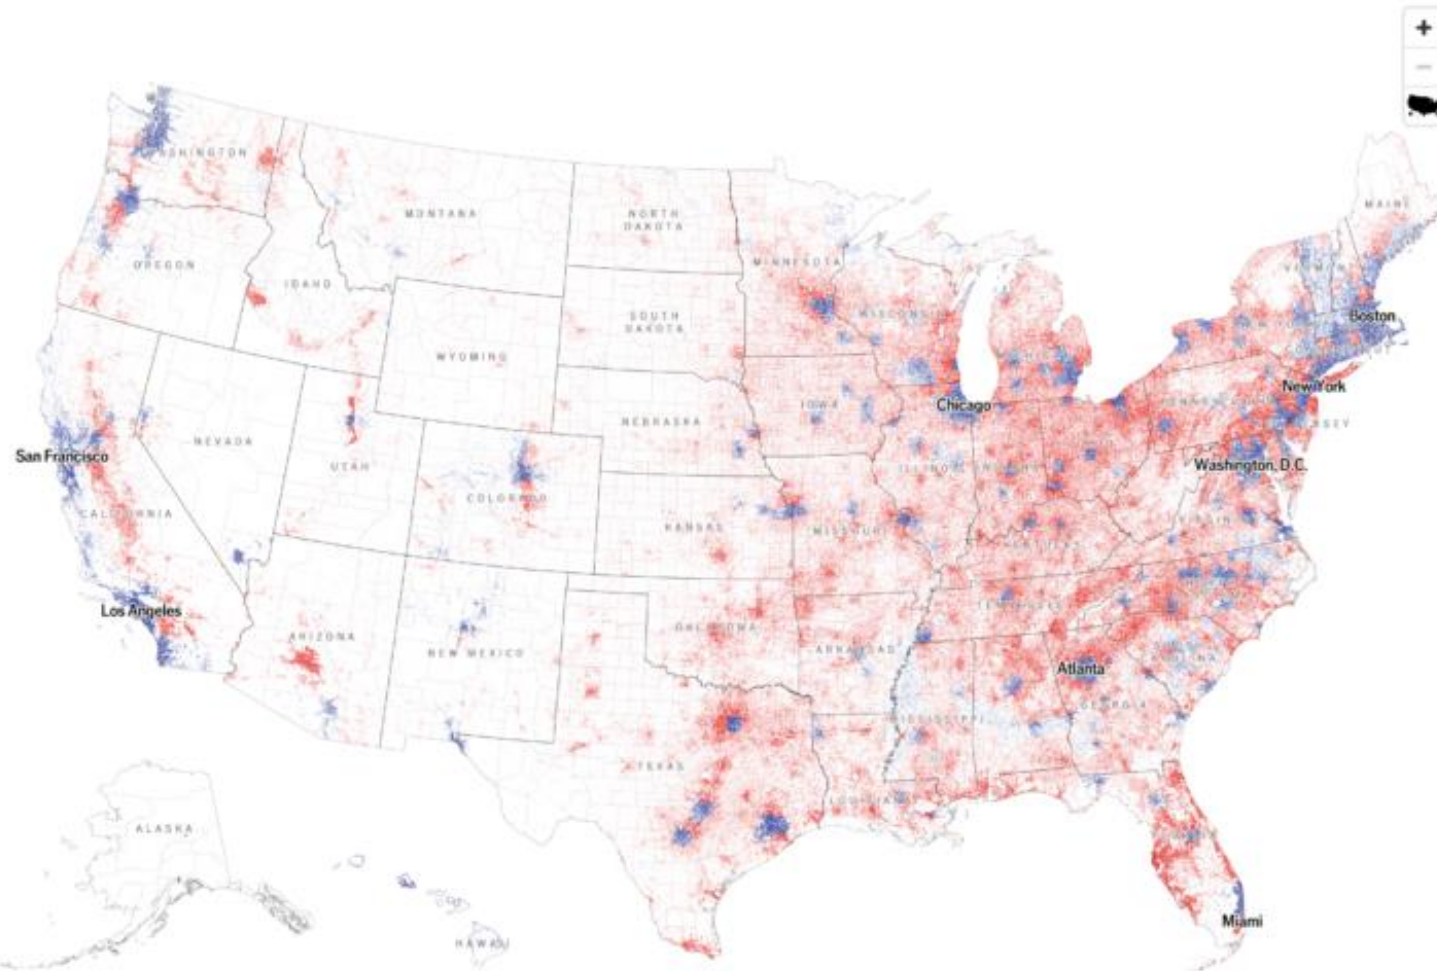

# Area Principle – 2024 Election Map

# Area Principle – 2024 Election Map

# Area Principle – 2024 Election Map

# Histograms

# Plotting Numerical Distributions

**Binning** converts a numerical distribution to a categorical distribution

**Binning** counts the number of numerical values that lie within a range, aka a bin

Bins contain:

- A lower bound (inclusive)
- An upper bound (exclusive)

# Bins - Example

Bins contain:

- A lower bound (inclusive)
- An upper bound (exclusive)

188, 170, 189, 163, 183, 171, 185, 168, 173, ...

# Histogram

Chart that displays the distribution of a numerical variable

Uses bins; there is one bar corresponding to each bin

Uses the area principle:

- The **area** of each bar is the percent of individuals in the corresponding bin

# Understanding Histograms

Axes

Height

Area

# Histogram Axes

By default, `hist` uses a scale (`normed=True`) that ensures the area of the chart sums to 100%

The **area** of each bar is a percentage of the whole

The horizontal (x-) axis is a number line (e.g., years), and the bins sizes don't have to be equal to each other

The vertical axis is a rate (e.g., percent per year)

## Histogram Height (of a bin)

$$\text{Height} = \frac{\% \text{ in bin}}{\text{width of bin}}$$

Height measures density

the percent of data in the bin *relative to the amount of space in the bin*

Units: percent per unit on the horizontal axis

# Histogram Area (of a bar)

Area tells us what percent of all data is in a bin

Area of a bar = Height times width of a bin

- *“How many individuals in the bin?”* Use area.
- *“How crowded is the bin?”* Use height

# Bar Chart or Histogram?

## Bar Chart

- Distribution of categorical variable
- Bars have arbitrary (but equal) widths and spacings
- **height (or length)** and **area** of bars proportional to the percent of individuals

## Histogram

- Distribution of numerical variable
- Horizontal axis is numerical: to scale, no gaps, bins can be unequal
- **Area** of bars proportional to the percent of individuals; **height** measures density

# Functions

# Anatomy of a Function

Name

Parameters / Argument Names

Body

Return Expression

## Example Function

```
def sread(values):  
    spread_val = max(values) - min(values)  
    return spread_val
```

# Example Function

Name

```
def spread(values):  
    spread_val = max(values) - min(values)  
    return spread_val
```

# Example Function

Argument Names / Parameters

```
def sread(values):  
    spread_val = max(values) - min(values)  
    return spread_val
```

# Example Function

```
def sread(values):  
    spread_val = max(values) - min(values)  
    return spread_val
```

Body

## Example Function

```
def sread(values):  
    spread_val = max(values) - min(values)  
    return spread_val
```

Return Expression

# Example Function

# What does this function do?

```
def f(s):  
    return np.round(s / sum(s) * 100, 2)
```

What kind of input does it take?

What output will it give?

What's a reasonable name?
