

# DS 100 – Intro to Data Science

Lecture 8 – Pivot, Joins, Comparison

02/13/2025

Adam Poliak

BRYN MAWR  
COLLEGE

# Announcements

Lab03 ([Functions & Visualizations](#)) due Friday

HW03 – Functions, Histograms, and Groups:

- Due Wednesday (02/19)

Checkpoint/Project 1:

- Paired assignment that covers the previous section of the course material
- Released today
- Due Wednesday 02/28

BRYN MAWR  
COLLEGE

# Example Function

The diagram illustrates a Python function definition with the following annotations:

- Name:** Points to the word `sread`.
- Argument Names / Parameters:** Points to the parameter `values` in the line `sread(values)`.
- Body:** Points to the code block following the colon, including the assignment statement and the `return` statement.
- Return Expression:** Points to the expression `spread_val` in the `return` statement.

```
def sread(values):
    spread_val = max(values) - min(values)
    return spread_val
```

# Applying Functions to Columns

The `apply` method creates an array by calling a function on every element in input column(s)

- First argument: Function to apply
- Other arguments: The input column(s)

```
table_name.apply(function_name, 'column_label')
```

# Grouping by One Column

The **group** method aggregates all rows with the same value for a column into a single row in the resulting table.

- First argument: Which column to group by
- Second argument: (Optional) How to combine values

**len** — number of grouped values (default)

**list** — list of all grouped values

**sum** — total of all grouped values

# Lists as Generic Sequences

A list is a sequence of values (just like an array), but the values can all have different types

```
[2+3, 'four', Table().with_column('K', [3, 4])]
```

Lists can be used to create table rows.

If you create a table column from a list, it will be converted to an array automatically

# Grouping by Multiple Columns

The **group** method can also aggregate all rows that share the combination of values in multiple columns

- First argument: A list of which columns to group by
- Second argument: (Optional) How to combine values

# Pivot Example

```
sky = Table.read_table('skyscrapers_v2.csv')
```

name	material	city	height	age
One World Trade Center	mixed/composite	New York City	541.3	6
Willis Tower	steel	Chicago	442.14	46
432 Park Avenue	concrete	New York City	425.5	5

```
sky.pivot('material', 'city')
```

BRYN MAWR  
COLLEGE

# Pivot description

`Tbl.pivot(col1, col2)`

1. **string**: name of column whose unique values will make up columns of pivot table
2. **string**: name of column whose unique values will make up rows of pivot table

`sky.pivot('material', 'city')`

BRYN MAWR  
COLLEGE

# Pivot Example

```
sky.pivot('material', 'city')
```

	name	material	city
	Willis Tower	steel	Chicago
	Trump International Hotel & Tower	concrete	Chicago
	Aon Center	steel	Chicago
	John Hancock Center	steel	Chicago
	Bank of America Plaza	mixed/composite	Atlanta
	U.S. Bank Tower	steel	Los Angeles
	The Franklin - North Tower	mixed/composite	Chicago
	JPMorgan Chase Tower	mixed/composite	Houston
	Two Prudential Plaza	concrete	Chicago
	Wells Fargo Plaza	steel	Houston

# Pivot Example

```
sky.pivot('material', 'city')
```

city	concrete	mixed/composite	steel
Atlanta			
Austin			
Baltimore			
Boston			
Charlotte			
Chicago			
Cincinnati			
Cleveland			
Columbus			

	name	material	city

# Pivot Tables

Cross-classifies according to two categorical variables

Produces a grid of counts or aggregated values

Two required arguments:

- First: variable that forms column labels of grid
- Second: variable that forms row labels of grid

Two optional arguments (include **both** or **neither**)

`values='column_label_to_aggregate'`

`collect=function_to_aggregate_with`

BRYN MAWR  
COLLEGE

# Group vs Pivot

## Pivot

- One combo of grouping variables **per entry**
- **Two** grouping variables: columns and rows
- Aggregate values of **values column**
- Missing combos = **0 (or empty string)**

## Group

- One combo of grouping variables **per row**
- **Any number** of grouping variables
- Aggregate values of **all other columns** in table
- Missing combos **absent**

# Joining Two Tables

`tblA.join(colA, tblB, colB)`

`tblA.join(colA, tblB)`

BRYN MAWR  
COLLEGE

# Table Review

`t.select(column, ...)` or `t.drop(column, ...)`

`t.take([row, ...])` or `t.exclude([row, ...])`

`t.sort(column, descending=False)`

`t.where(column, are.condition(...))`

`t.apply(function, column, ...)`

`t.group(column)` Or `t.group(column, function)`

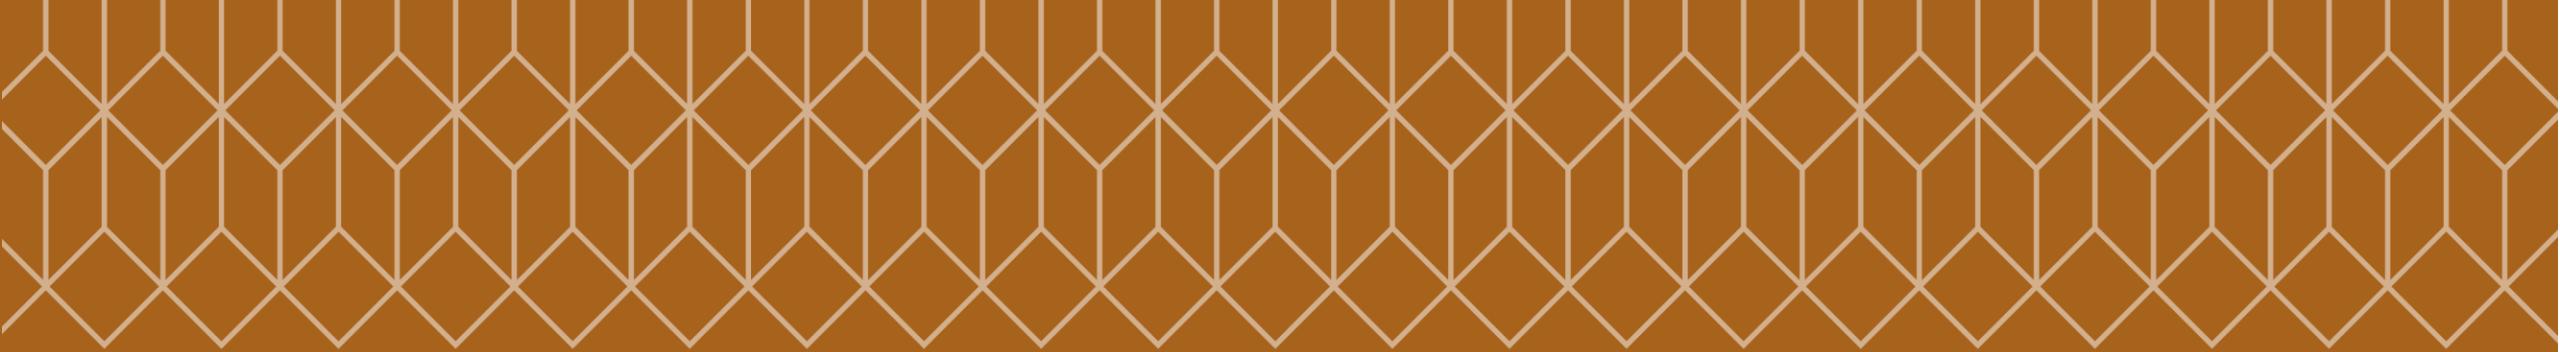

`t.group([column, ...])` or `t.group([column, ...], function)`

`t.pivot(cols, rows)` or `t.pivot(cols, rows, vals, function)`

`t.join(column, other_table, other_table_column)`

# Comparisons

BRYN MAWR  
COLLEGE

---

brynmawr.edu 

# Comparison Operators

Operator	Table predicate
<code>==</code>	<code>are.equal_to</code>
<code>!=</code>	<code>are.not_equal_to</code>
<code>&gt;</code>	<code>are.above</code>
<code>&gt;=</code>	<code>are.above_or_equal_to</code>
<code>&lt;</code>	<code>are.below</code>
<code>&lt;=</code>	<code>are.below_or_equal_to</code>

The result of a comparison expression is a `bool` value:

`True`, `False`

BRYN MAWR  
COLLEGE

# Comparison Operators

The result of a comparison expression is a **bool** value

$x = 2$

$y = 3$

BRYN MAWR  
COLLEGE

# Comparison Operators

The result of a comparison expression is a **bool** value

`x = 2`

`y = 3`

Assignment  
Statements

BRYN MAWR  
COLLEGE

# Comparison Operators

The result of a comparison expression is a **bool** value

`x = 2`

`y = 3`

Assignment  
Statements

`x > 1`

`x > y`

`y >= 3`

`x == y`

`x != 2`

`2 < x < 5`

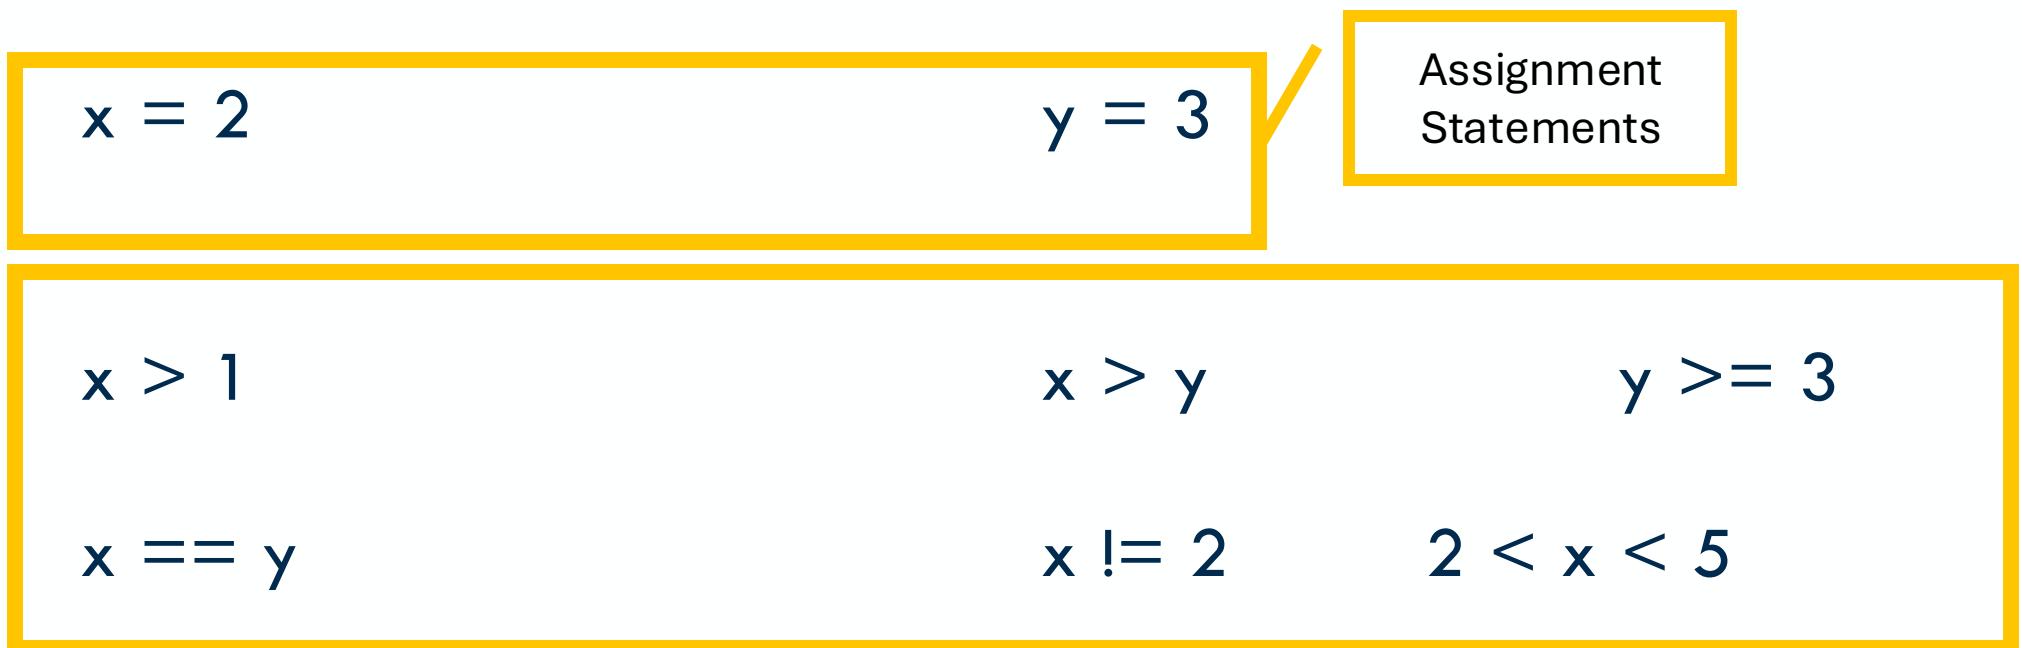

BRYN MAWR  
COLLEGE

# Comparison Operators

The result of a comparison expression is a **bool** value

# Combining Comparisons

The result of a comparison expression is a **bool** value

a = True

b = False

not b

a or b

a and not b

a and b

not (a or b)

b and b

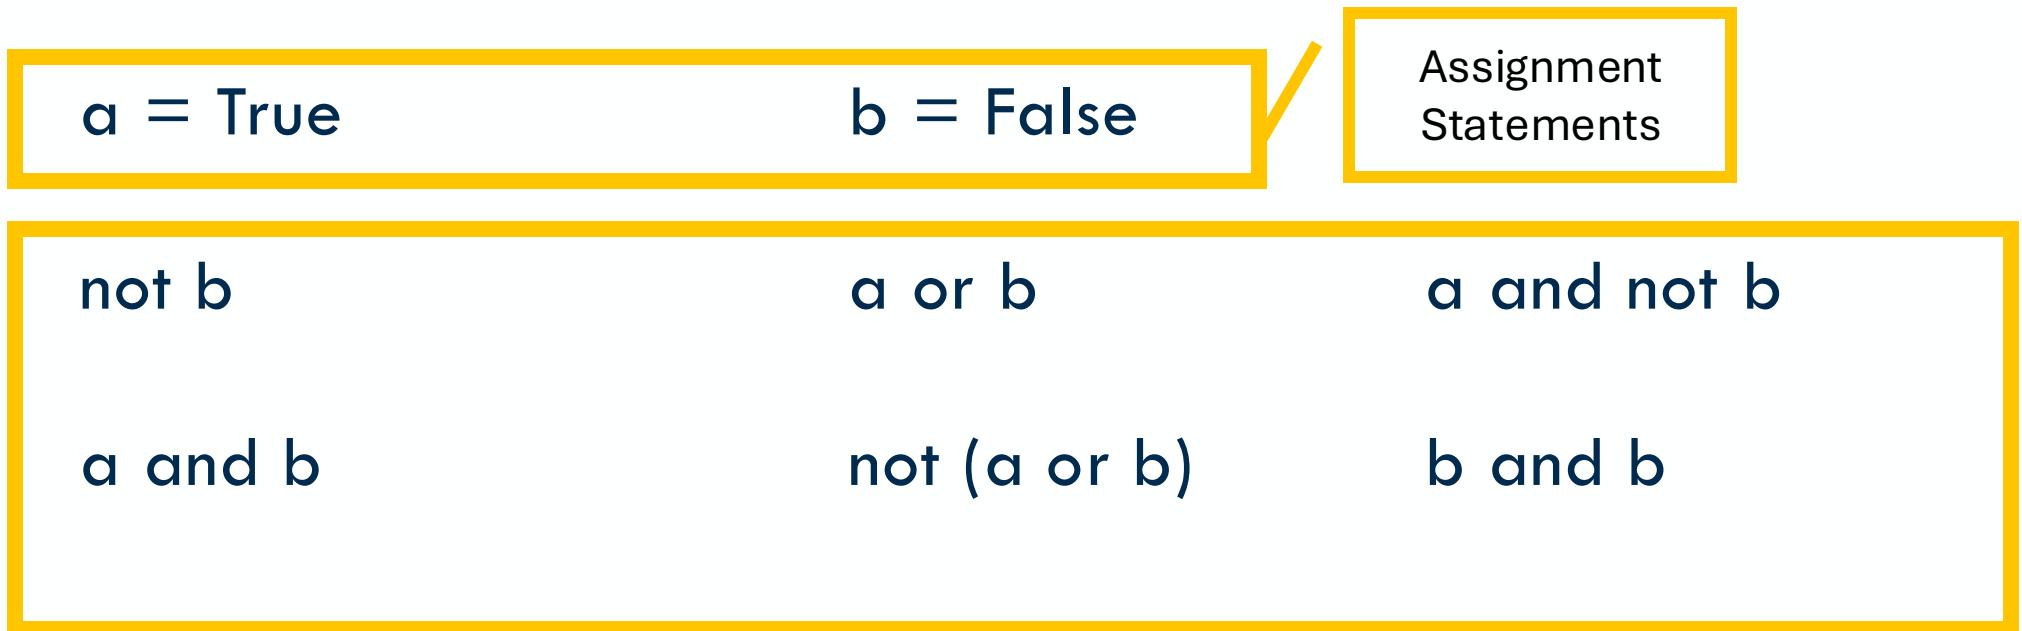

BRYN MAWR  
COLLEGE

# Combining Comparisons

The result of a comparison expression is a **bool** value

BRYN MAWR  
COLLEGE

# Combining Comparisons

The result of a comparison expression is a **bool** value

$a = \text{True}$

$b = \text{False}$

Evaluate to True

$\text{not } b$

$a \text{ or } b$

$a \text{ and not } b$

$a \text{ and } b$

$\text{not } (a \text{ or } b)$

$b \text{ and } b$

Evaluate to False

BRYN MAWR  
COLLEGE

# Aggregating Comparisons

Summing an array or list of `bool` values count the number of `True` values

`1 + 0 + 1`

`True + False + True`

`sum([1 , 0 , 1])`

`sum([True, False, True])`

# Control Statements

brynmawr.edu  
COLLEGE

# Control Statements

These statements *control* the sequence of computations that are performed

The keywords `if` and `for` begin control statements

The purpose of `if` is to define functions that choose different behavior based on their arguments

# Random Selection

brynmawr.edu  
COLLEGE

# Random Selection

`np.random.choice`

- Selects at random
- With replacement
- From an array
- A specific number of times

`np.random.choice(some_array, sample_size)`

BRYN MAWR  
COLLEGE

# Appending Arrays

brynmawr.edu  
COLLEGE

# A longer array

`np.append(array_1, value):`

- new array with value appended to array\_1
- value has to be of the same type as elements of array\_1

`np.append(array_1, array_2):`

- new array with array\_2 appended to array\_1
- Elements of array\_2 have to be of the same type as elements of array\_1

BRYN MAWR  
COLLEGE

# Iteration

brynmawr.edu  
COLLEGE

# for statements

`for` is a keyword that begins a control statement

The purpose of `for` is to perform a computation for every element in a list or array

BRYN MAWR  
COLLEGE
